HOW I TRAIN IN MASTERS SWIMMING

by

Burwell (Bumpy) Jones, M.D.

About a dozen years ago, June Krauser, the editor of Swim-Master, asked me to write an article on my training methods since she had received a letter of interest from a masters swimmer (honestly, not a relative). At that time I declined because I really didn't know much about training for masters competition, nor did anyone else. Masters competition didn't start until 1971 and even those of us who have been involved since the beginning, used training methods from our coaches of younger years or invented methods suited to our ages and our life-styles. Now that masters swimming has a 15 year history, it is possible to collect some ideas which may be helpful to other masters swimmers, especially those who may be starting their masters careers.

All of us who are masters swimmers are influenced by the teachings of coaches and swimmers that preceded us. I have been involved in competitive swimming since the age of four and now at the age of 52 am still learning bits of knowledge that someone knew years ago and that I may have known but have forgotten. Everything that I know about swim training must first relate to my coaches. However, no one has a greater experience than 15 years for masters training and year-round programs for adults may create several problems, physical and social.

I am basically a middle distance swimmer and an individual medley swimmer so, therefore, my training ideas reflect these goals. Because of my compulsive nature, I have kept accurate records of my entire masters career starting in 1971. I have kept a log of work-outs so that I have daily, monthly, and yearly total yardages swum. (I have been accused by my long suffering wife, Rita-al, of being toilet trained too early—perhaps true.) I keep records of good sets in work-outs, meet times and a daily record of my weight. I am quite compulsive about daily swims and on my yearly wall calendar, where I record the daily distance swum. I dread the occasional zero (0) day. In 1978, there were no zero days and in 1979, one zero day. (Actually, on that day, June 6th, I had gone to Florida's east coast for a golf tournament and drove around for

an hour in a rainstorm looking for a pool, before I gave up.) It has been five months since my last zero day.

TRAINING IDEAS: #1 I swim daily, if at all possible. Even a few yards keeps my "feel" of the water and keeps my flexibility intact. #2 I keep a daily log of distances, important sets in work-outs and other information which can be used in the future. I calculate my distance averages weekly, monthly and yearly. For many years I have been hearing stories of masters swimmers who "average" 8000 to 10,000 yards a day. I suspect that many of these people failed arithmetic 101 and their "averages" are for the days they work-out (three to four days a week) and for only the few weeks before the national championships. If one takes a true average, then simple arithmetic can demonstrate that 8000 yards a day in four days is 32,000 yards for the seven day week, which is an average of 4571 yards per day. This is still a good average if carried for a longer period of time but has no where near the bragging rights of the stated 8000 yards a day. (In the calculation of averages, I don't forget the rest days, tapering days and meet days, all of which drastically lower my averages. Even a five event meet with warm-up and warm-down may be well less than 2000 yards.)

In the years that I have done well in masters competition, my averages have been high, especially in the months preceding the national meets. This appears to be the most important factor in my training. If I can carry a high daily average of training for a prolonged period of time, I can nearly always expect good results in competition. In 1972, I averaged 2305 yards a day (for 365 days). In 1974, I averaged 3697 yards a day with both May and August over 5000 yards a day. (I consider 1974 my best year in masters swimming with my best times and my best averages.) In 1976 and 1977, I averaged 3230 yards a day and then my averages dropped to about 2100 yards a day in 1979 and 1980. I did not compete in any meets from the summer of 1980 until the fall of 1984 and during those years averaged only 800 yards a day.

In this year of 1984-85, I have been training for slightly over six months and have maintained

an average of over 5000 yards a day. This has been a maximum effort for me in masters training and, in fact, for my swimming at any age. (Note that this average requires some days of over 10,000 yards to cover the light distance days.)

#3 My quality of swimming in work-outs has always been best by working our with a coach and a team. In 1974, I swam and trained with a high school team. I competed in some open meets with them and benefited by swimming against faster swimmers. Currently, I train with a masters team, (Suncoast Masters) and we have an age-group coach (Robin White) who works with us three nights a week.

Quality of work-outs is difficult to discuss in a short article. Basically, every work-out of mine will have at least one set which is physically draining and "hurts". When training hard, I may have two or three hard sets or a distance of 2500 to 3000 yards of maximum effort. I believe that it takes about three months of good training for me to be able to tolerate a good work-out, recover and be able to return the next day for another work-out. Since I have four strokes in which to train and must also train for middle distance swimming, I have acquired and devised a vast number of ways to vary work-outs. These variations are more important from a psychological factor than any other reason.

Within our masters group, we usually set our time intervals in the repeat sets for the fastest swimmers and then vary the distances or the times for the slower swimmers. For example, the fast lane can do 10- two hundreds on the 2:30 with the slower lanes doing 10 on 2:45, 3:00 etc. If all swimmers are to be kept on the same interval, the fast lane can do 200's at 2:30 with the other lanes doing 150 yards or 100 yards on the same interval.

When working out alone, I frequently use the "fartlek" (slow-fast) type of training since it is a fast way to get in yardage and I am often pressed for time. This slow-fast type of swimming forces me to racing speed and the variables help to eliminate boredom. I usually do a brief work-out at noon during the week of 1200-1800 yards and then my major work-out at six p.m. of 3000 to 5000 yards. My major distance work-outs are usually Wednesday afternoons and week-ends. A frequent noon fartlek is a 600 yard swim, a 600 yard slow-fast by 25's, and then 600 yards slow-fast by 50's. I usually do kicking and pulling on a fartlek system.

#4 Weight training is essential for swimming. It is done by all world-class swimmers but for some reason is omitted by many masters swimmers. I have to use the weight training carefully since heavy loads seem to give me joint discomfort, especially in the shoulders. I have used Nauti-

lus training equipment since early in my masters career and I believe that it is good equipment for a swimmer. I also use some free weights but I must admit that I am not fond of weight training and am more comfortable in the water when I'm not using weights. I try to use weights three times a week, but I miss occasional days. I taper the weight work for seven to ten days before the meets.

#5 I am quite concerned about maintaining proper nutrition. I do not believe that the nutritional needs of masters swimmers are any different than the rest of society, but much of the nutrition of society is terrible. I do not believe in food supplements and other concoctions that are promoted by faddists and am, frankly, offended by many self-proclaimed nutritional experts. Since I have a family history of early coronary vascular disease and like to eat, I have changed my dietary habits greatly in the past 20 years. My normal diet is low in cholesterol, low in fat and high in fiber. I take a daily multiple capsule as a form of "super-nutrition", although I doubt that it is of any value. Since I am frequently asking my body for maximum performance, I think this extra seems reasonable. My alcohol intake is occasional light beer or wine. I do not smoke and have no tolerance for those that do.

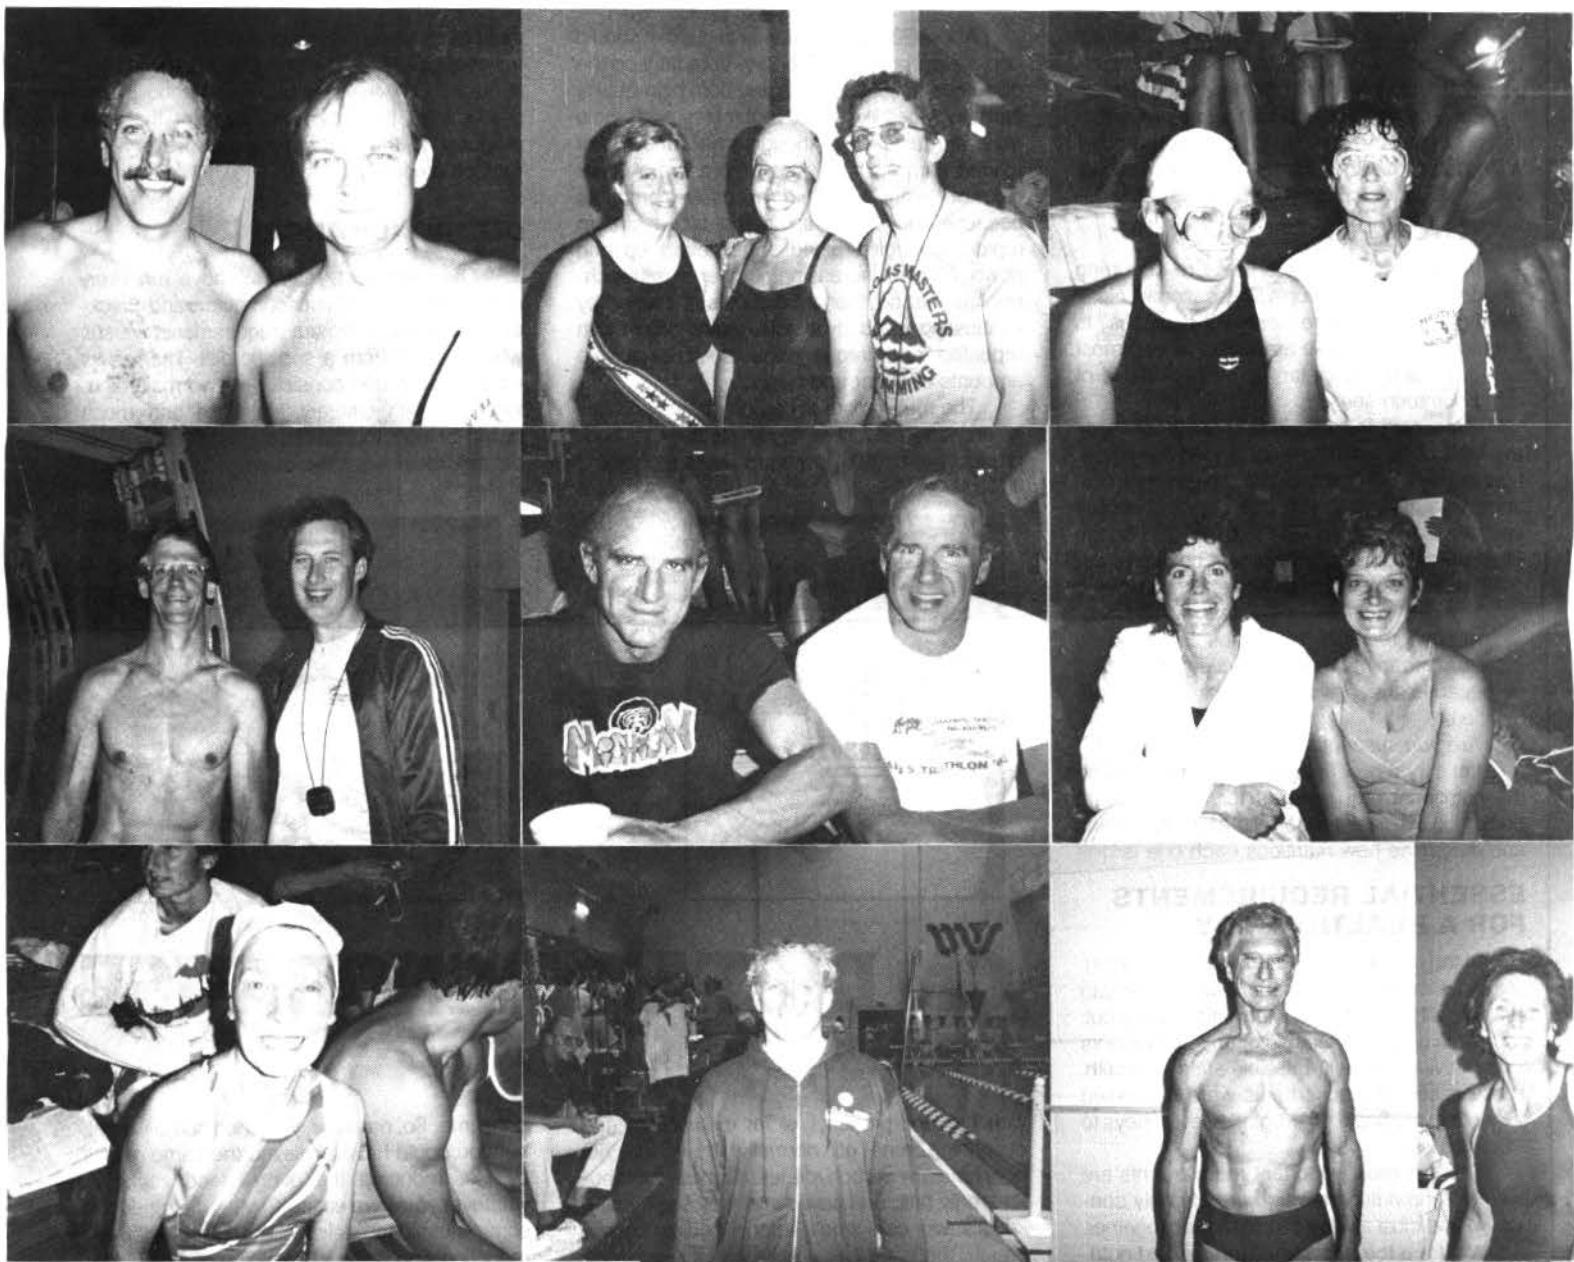

#6 Psychologic factors are important in masters swimming. One of the reasons I did not compete between 1980 and 1985 is that I lost much of my desire to compete. Thus, with the lack of competition, I progressively lost my training desire as well. This again emphasized, for me, the purpose of masters competition.

I truly do not know how to stimulate myself with the perpetual desire to compete and I note my fluctuations of the past 15 years so that I must expect some fluctuations of desire in the future.

The purpose of masters swimming for me is good sport, good health and good fellowship. I don't believe that there is any good evidence that swimming will prolong my life, but it certainly has improved my life. The training of masters swimmers must be somewhat different than for age group or collegiate swimmers and perhaps some of these ideas can assist other masters swimmers in their training.

BURWELL JONES, M.D.

MASTERS SWIMMING NATIONAL SHORT COURSE CHAMPIONSHIPS

ROW 1: Mike Laux and Jeff Farrell - Mike, President of USMS, is the 1984 recipient of the Capt. Ransom J. Arthur, M.D. Award. Congratulations, Mike!

Gail Dummer, Diane and Leo Letrende - Gail is USMS Zone Chairman, Diane & Leo officers in Ozark LMSC. Jane Murphy-Sherman and Dorothy Donnelly - Dorothy is our able USMS Secretary.

ROW 2: Tom Boak and Bill Tingley - Tom is USMS Championship Chairman while Bill is Heartland Zone Chairman. Donald Hill and Edward Hinshaw - Powerful swimmers! Lynn Morrison-Casey and Millie Larsen - Fast swimmers!

ROW 3: Jeannette Eppley - Breaking butterfly records again! Ross Lambert - Registration chairman for Central LMSC. Paul Huttinger - One of the original founders and promoters of Masters Swimming. Sperry Rademaker - Also an Olympic Kayaker.

ROW 4: Edie Grunder and Lisa Botago - Arizona Masters. David Babolt - Only swimmer I know that lives in Idaho. Ted Haartz, Bob Heritier and Wally Dobler - Are they comparing times?

Thinking of going on another diet? Looking for another gimmick to shed a few quick pounds? Convinced that a "new special diet" in a can is really worth all that money? Certain that an expensive diet won't harm your body? Willing to pop another pill that (they claim) allows you to eat as much as you want?

YOU CAN'T BE SERIOUS.

What is it that causes these re-occurring diet-diseases that hit people like seasonal colds? What can we do to cure these diet-diseases? Is it really true that people are willing to try almost any quick-scheme dietary gimmick instead of using common sense?

Examining the details and usage of many available diets, I'm almost convinced this is true. I get the feeling that the bigger the dietary ignorance in a new diet, the better it sells. In my opinion, the Beverly Hills Diet, the Cambridge Diet, starch blockers and others belong under this heading. Most diets should really be labeled "dietary deficiencies" or "dietary rip-offs" because the ingredients could be purchased in the local supermarket for just a fraction of the cost, or because they give you highly incomplete nutrition.

Are you susceptible to such gimmicks?

Let's try a new approach. First we'll outline the nutritional requirements for an exercising body. Next we'll take a look at the latest diet-fads and determine how nutritious each one is.

ESSENTIAL REQUIREMENTS FOR A HEALTHY BODY

At the outset we must understand one thing: nothing is 100% established. However, we can evaluate all the scientific information, sort it out, and come up with some minimum requirements for achieving the best possible state of health. These essential requirements were discussed at length in my book "Dr. Kugler's Seven Keys to a Longer Life."

The two most important requirements are exercise and nutrition, which are strongly connected and must always be considered together.

What are the minimum exercise and nutrition requirements for optimum health?

EXERCISE: Here we can look at heart disease statistics (J. N. Morris, England), reversal of atherosclerosis (N. Pritikin, Santa Monica), treatment of depression (J. Greist, University of Wisconsin), and the very successful treatment of diabetes (J. Anderson, VA-hospital, Lexington, Kentucky), and they will all agree on the following minimum amount of exercise; it should be done at least three times per week, at least 45 minutes without interruptions, and it should be vigorous. "Vigorous" is defined as achieving the correct pulse rate during the exercise sessions; 70 to 80% of (220 minus age). Example: a 40 year old person would achieve the best effect by exercising at a pulse rate of 126 to 144 (70 to 80% of 220-40).

NUTRITION: In order to maintain a normal weight, the caloric intake must equal the caloric output. If we want to shed some weight, the caloric intake must be less than the output. 3500 calories, expressed as food or exercise calories, are equivalent to one pound of excess body fat.

About 20% of all calories in our diet should come from protein, 25 to 35% from fat, and the difference should come mainly from high-quality carbohydrates like fruits, vegetables, and whole grain products. Even though small amounts of refined carbohydrates don't represent a major risk, we want to avoid excessive amounts because they wind up in the blood stream rapidly, changing blood sugar levels up and down. An ever-increasing number of researchers feel that adult-onset diabetes is caused by exhausting the body's insulin mechanism with repeated and frequent insults of excessive amounts of sugar and sweets.

The metabolism of carbohydrates and fats in our body involves many steps. The end-products of carbohydrate metabolism combine

must be low in fat (now supplied by the body's fat reserves) and it must include high-quality carbohydrates. Only this way can the metabolic end-products of the fats combine with the end-products of the carbohydrates, so everything runs off smoothly.

DIET IGNORANCE

Over the past years we have run every possible diet through our computers and checked nutritional minimum requirements versus what you get from a specific diet. The results were obvious and consisted of two major findings: 1) With different gimmicks and much hullah-baloo, most diets supplied much fewer calories than what the average person would

ON DIETARY IGNORANCE

by Hans J. Kugler, Ph.D.

with the end-products of fat metabolism and everything runs off normally. If we do not consume any carbohydrates, our body metabolizes only fats, and we go into "ketosis." During ketosis we can smell ketone bodies on our breath, the urine has a quite distinct smell, we have the urge to urinate more often, the pH in our body changes and enzyme systems are affected. These are the typical signs of diabetes and we definitely don't want to induce them with the wrong diet.

Our meal schedule should include a good breakfast, a reasonable lunch, and a small dinner during the early part of the evening. The biggest problem with weight-control is usually a large dinner consumed late at night.

The daily caloric requirement to maintain your present body weight or your ideal body weight can be computed by multiplying your ideal body weight by 15 calories per pound per day. Adjustments should be made for age: 1 calorie less per pound per day for each 10 year period over 30 years of age. For details and sample calculations see p. 2 of the Nutritional Guidance Booklet by Dr. Paul Ward. In order to shed pounds, we must dip below the daily caloric maintenance level, but not below 1200 calories per day. Proper nutrition cannot be maintained in diets of fewer than 1200 calories per day. To avoid ketosis, a weight-loss diet

consume. So, naturally, you shed some weight, but you could have achieved the same results by just reducing the overall food intake of whatever you were eating. 2) Most diets induced some nutritional deficiencies along with the reduction in calories. This is dangerous! Either they induced the symptoms of diabetes by cutting out all carbohydrates, or roughage was very low (roughage is important to prevent cancer of the digestive tract); protein intake was either too low or far too high; they induced serious imbalances between the minerals calcium and phosphorus (can induce secondary hyperparathyroidism); or they dipped so far below minimum caloric levels that only few of the minimum nutritional requirements were obtained.

It is really quite important to find out if your diet supplies all the required nutrients. Many doctors are using computerized programs that include health practices education and an evaluation of disease risks. If your doctor doesn't use one of these programs, or if you just can't find one, send us a self-addressed and stamped envelope and I'll see that you get some free information about health practices and how to evaluate your nutrition with a computer program. (International Academy of Holistic Health & Medicine, IAHHM, att. Dr. Kugler, 218 Ave. B, Redondo Beach, California 90277.)

TWO RECENT DIET FADS

THE CAMBRIDGE DIET

It consists of a powder that supplies 330 calories per day and contains protein, some carbohydrates, vitamins and minerals.

You will recognize immediately that the 330 calories are far below the minimum caloric intake of 1,200 calories explained earlier. Even though the Cambridge Plan provides the recommended vitamin and mineral requirement, the plan is still unsafe because it does not provide enough calories to operate the body systems. Consequently, large volume of lean mass (muscle) are lost because the body converts the muscle mass into required carbohydrate. Consequently, very little fat is lost. The end result is that one loses weight, but most of the loss is muscle mass and water, while reducing one's potential to perform optimally physically and mentally. In order to recognize the dangers of this diet, one must evaluate the entire Cambridge plan.

The Cambridge plan talks about exercise, but in reality it recommends only a very limited number of stretching and bending exercises. This amount of exercise is again far below the minimum requirements outlined earlier. Hopefully you are doing the minimum amount of exercise, or more, and therefore the 330 calories per day are totally insufficient for you. The chances that you will induce ketosis in your body is almost 100%.

People who do a good amount of exercise and follow the Cambridge diet keep telling me that they always feel terribly hungry, they often feel faint, they perspire easily, and that they are looking forward to eating normally again.

The Cambridge diet also costs a lot of money. It contains nothing that you couldn't get for a fraction of the cost in your local supermarket. What you find in a one-day supply of the Cambridge diet can, for example, be obtained from 1 glass of non-fat milk, a few ounces of broiled fish, some steamed vegetables and a good vitamin and mineral tablet.

The use of the Cambridge diet would make some sense if people would eat a normal breakfast, smaller lunch and just replace the dinner with the Cambridge drink. People would probably save at least 900 calories per day. But then you could achieve the same results by eating only half of a healthy sandwich instead of the Cambridge drink and you'd save more money. Now you go for a long walk every day instead of drinking two beers, and the total caloric savings amount to about 2 pounds per week.

STARCH BLOCKERS

First, let's review a few facts about digestion and general nutrition.

Ingested foods are hydrolyzed (taken apart) in the digestive tract into their basic building blocks. Proteins give amino acids, fats give glycerol and free fatty acids, and carbohydrates give simple sugars like glucose.

There is one major difference between refined (mainly sugars and products made with

sugar and white flour) and complex (vegetables, whole grains, fruits) carbohydrates: This is the rate, or speed, at which they are hydrolyzed and wind up in the blood as glucose. For refined carbohydrates this rate is very fast, causing blood sugar ups and downs. This we don't want! Complex carbohydrates (mainly starch-based foods) hydrolyze slowly, feeding glucose into the blood stream at approximately the rate the body can burn and store it. That's what we want.

The typical (bad) American junk food diet contains lots of fat, some protein, and lots of refined carbohydrates.

Starch blockers affect only the rate of hydrolysis of starch-based foods. If the starches are not hydrolyzed, they are not absorbed as glucose, and therefore they are eliminated and the calories don't count. Sounds good? Well, it really isn't!

Assume you use starch blockers on a reasonable diet that contains fats, proteins, vegetables, and some refined carbohydrates. The vegetables are not hydrolyzed and what winds up in the blood are essentially the components of the typical junk food diet.

Using starch blockers makes a little bit more sense if the food intake consists of lots of starches, very little fat, sufficient protein, and little or no sugars. Using only a small amount of starch blockers will now prevent the hydrolysis of some of the starches, and since there are only small amounts of sugars or refined carbohydrates, glucose is fed into the blood at the desired slow speed. But many people will probably over-do it as usual, thinking that if one tablet of starch blockers is good, two or three must be better. We must also recognize that the vitamin and mineral contents of complex carbohydrates that are not hydrolyzed are also not utilized by the body.

Users of starch blockers also often complain about excessive amount of gas. Is this just a side-reaction that we should ignore? Is it caused by mis-use of the starch blocker? Does this signal a serious problem in the digestion and absorption of foods?

A WORD OF ADVICE

Instead of spending much money on a new diet, and risking your health, rather learn about good nutrition and practice it. Nutrition is very easy. Your nutrition should consist of unadulterated foods, grown fresh, low in animal fats and refined carbohydrates (sugar and white flour), high in complex carbohydrates (vegetables, whole grain products, fruits), and sufficient (rather on the high side) in low-fat protein. A good vitamin and mineral supplement will make it perfect.

A CASE HISTORY

A man who was over-weight all his life, and who had practiced literally every new diet, learned that far up in the mountains there lived a guru who had all the answers. So he traveled for days, climbed the mountain, and when he finally found the guru he asked: "Master, what is the secret of good health and maintaining a normal weight?" And the guru answered, "Good nutrition and exercise!"

CONCLUSION:

There is no easy way to lose fat. The best approach is to prevent fat from accumulating. This means exercise and control of caloric intake. Once the fat has accumulated, one must exercise vigorously and consistently while sensibly controlling caloric intake. (Never drop below 1200 calories with a balanced nutritional program.) Refer to the Nutritional Guidance Book for more information.

The use of extremely low calorie diets may result in harming one's health. Extreme dietary plans should not be practiced. A sensible combination of exercise and nutrition programs must become a part of one's daily pattern of living and should be followed consistently throughout life.

EDITOR'S NOTE: RESEARCH UPDATE

Seventeen deaths within a six-month period in late 1977 most probably resulted from extremely low calorie (300-400 calories per day) diets—fifteen of them liquid and/or high protein diets—according to a recent report from the Center for Disease Control and the Food and Drug Administration. This was a period when liquid protein diets were popular.

In all cases, the cause of death was intractable ventricular arrhythmias (sudden irregular heartbeats). Each person had been adhering strictly to the diet for a prolonged period of time (two to eight months), and as a result had lost large amounts of weight in a very short time.

All the deaths occurred in people who were relatively young, with the median age of thirty-five. The two people who had not used liquid or high protein diets had been using powdered products containing carbohydrates.

THE REPORT RECOMMENDED
THAT ALL VERY LOW-CALORIE
WEIGHT LOSS PROGRAMS BE
TAKEN OFF THE MARKET UNTIL
FURTHER RESEARCH IS DONE.

(The American Journal of Clinical Nutrition, 35:453-461, April, 1981.)

COMMENT FROM DR. WARD:

Don't fool with Mother Nature. Regardless of one's beliefs and philosophy, truth (science) prevails. It seems to me that most people would rather believe the lie than the truth. Don't chase after the "Golden Fleece." There are no easy ways or secrets.

The recent Cambridge diet program is another potentially dangerous dietary plan, without medical supervision. In a pilot project conducted by me involving one male subject, the following was observed after a 22 day application of the Cambridge plan:

- | | |
|---|---|
| 1. Body Weight Loss | 12.75 lbs. |
| 2. % Fat Loss | .73 %
(less than 1% loss) |
| 3. Pounds of Fat Lost | 3.89 lbs.
(30% of Total Weight Lost) |
| 4. Lean Body Mass Lost | 8.86 lbs.
(70% of Total Weight Lost) |
| 5. The subject regained much of the lost weight in 1 month. | |

NOTE TO LMSC CHAIRMEN - Please check with your Registration Chairman and if they have a surplus of Registration Cards, please send them back to Gene Donner, 717 South Rd., East Aurora, NY 14052. GUESS WHO CAME TO SWIM? - by Dick Collins - "Doc" Councilman, renown swimming coach and English Channel swimmer, participated with the Kansas City Blazers in the regular Saturday workout last Oct. Doc was among the first into the pool and the last one out for the rigorous schedule of sets prescribed by Blazer Coach Dan LeVasseur. Councilman is as dedicated out of the pool as he is in. He exchanged reminiscences about swimmers as readily as offering tips for better swimming. "Coaching is fun, not work," said Doc, adding that he looked forward to continuing as a coach for another 10 years. "It's amazing how the body can attain a high degree of conditioning at any age," he said. He tests his own conditioning in long distance swimming. Among his swimming tips, Doc offered the following: 1) Swimmers over 60 should forget their age! and 2) Flip turns help to relieve back spasms and pain experienced by distance swimmers.....

NOTES ON SWIMMING FROM AEROBICS EXPERT DR. KENNETH COOPER

COOPER - If you have ready access to a pool, swimming is an ideal way to get your aerobic exercise. Running might be more popular, but swimming is better for several reasons, says Dr. Cooper. Swimmers get maximum cardiovascular benefits without setting themselves up for muscular or skeletal injuries. Swimming laps also gives the whole body--back, arms, legs, and lungs--a good workout. Before you dive in, be sure to protect yourself from swimmers' ailments. Wear goggles to shield eyes from burning chlorine, the chemical used to purify pools. After swimming, place a drop of alcohol in each ear to help ward off ear infections. If you swim in an indoor pool, be sure your pool is cleaned regularly. Indoor pools--especially pools protected by a 'bubble' during winter months--provide the moist, warm environments in which algae thrives. Also, make sure that the pool of your choice isn't too small for daily exercise. A 30-ft pool might cut your laps short and dampen your exercise enthusiasm by requiring you to make too many turns. It's possible to work up to burning off 20 calories a minute or 1200 calories an hour while swimming. The best runners never burn off more than 900 to 1000 calories an hour, Cooper says.....

REMINDER TO ALL MEET DIRECTORS - Please remember to inform your Zone representative of the dates, locations, and contact persons for your meet. Zone Representatives are responsible for compiling meet schedules for their areas and forwarding them to LMSC chairmen. Also, the person sanctioning meets in the LMSC should send the information of sanctioned events to the Zone rep.

Swimming News

USMS NATIONAL SHORT COURSE CHAMPIONSHIPS - 1985 - 650 men and 370 women entered the SC Championships held at the Walter Schroeder Aquatic Center in Brown Deer, WI, just north of Milwaukee. It was a very nice pool and a well run meet. Thanks to all those officials that worked so hard. The final results are not yet available. There were many records broken and many good swims. i.e., in the men's 50 free, Kevin DeForest (25-29) did 20.51; Jim Montgomery (30-34) did 21.15; Jeff Farrell (45-49) did 23.88; and Don Hill (55-59) did 23.47.....

A READER'S COMMENT - If Masters swim meets are getting too large, maybe start age of masters swimming at 30, instead of 25.....

WEIGHT LOSS RECORD - Petie Maguire of St. Pete Masters set what is believed to be a new Masters Swimming one day weight loss record -- 28 pounds! Husband John Maguire wants credit for an assist - he is awaiting a decision from the rules committee. Petie gave birth to Lacy Maguire (8 lbs) on Wed., April 17, 1985.....

RYALL WINS SWIM CHAMPIONSHIP - Amassing 2134 pts, the Ryall Masters Swim Team beat out 34 Illinois and other Midwest teams to win the first place trophy at the Central Masters Short Course Championships conducted at the College of DuPage pool in Glen Ellyn, IL. Ryall also won the LC championship last Aug. More than 400 men and women competed for the medals and ribbons given to the top eight in each event. Other team tro-
